## RELATIONS AND FUNCTIONS

- A relation R from a set A to a set B is a subset of the cartesian product $\mathrm{A} \times \mathrm{B}$ obtained by describing a relationship between the first element x and the second element y of the ordered pairs in $\mathrm{A} \times \mathrm{B}$.
Function : A function $f$ from a set A to a set B is a specific type of relation for which every element x of set A has one and only one image $y$ in set $B$. We write $f: A \rightarrow B$, where $f(x)$ $=y$.
$>$ A function $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is one-one (or injective) if $\mathrm{f}\left(\mathrm{x}_{1}\right)=\mathrm{f}\left(\mathrm{x}_{2}\right) \Rightarrow \mathrm{x}_{1}=\mathrm{x}_{2} \forall \mathrm{x}_{1}, \mathrm{x}_{2} \in \mathrm{X}$.
> A function $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is onto (or surjective) if given any $y \in Y, \exists x \in X$ such that $f(x)=y$.

## > Many-One Function :

A function $\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}$ is called many- one, if two or more different elements of $A$ have the same $f$ - image in $B$.

## $>$ Into function:

A function $\mathrm{f}: \mathrm{A} \rightarrow \mathrm{B}$ is into if there exist at least one element in $B$ which is not the $f$-image of any element in $A$.

## Many One-Onto function :

A function $f: A \rightarrow R$ is said to be many one- onto if $f$ is onto but not one-one.
Many One-Into function :
A function is said to be many one-into ifit is neither one-one nor onto.
A function $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is invertible if and only if f is one-one and onto.

## TRIGONOMETRIC FUNGTIONS AND EQUATIONS

General Solution of the equation $\sin \theta=0$ :
when $\sin \theta=0$
$\theta=n \pi: n \in$ Ii.e. $n=0, \pm 1, \pm 2$. $\qquad$
General solution of the equation $\cos \theta=0$ : when $\cos \theta=0$

$$
\theta=(2 n+1) \pi / 2, n \in \text { I. i.e. } n=0, \pm 1,+2 \ldots . . . . .
$$

General solution of the equation $\tan \theta=0$ :
General solution of $\tan \theta=0$ is $\theta=n \pi ; n \in I$
General solution of the equation
(a) $\sin \theta=\sin \alpha: \quad \theta=\mathrm{n} \pi+(-1)^{\mathrm{n}} \alpha ; \mathrm{n} \in \mathrm{I}$
(b) $\sin \theta=\mathrm{k}$, where $-1 \leq \mathrm{k} \leq 1$. $\theta=\mathrm{n} \pi+(-1)^{\mathrm{n}} \alpha$, where $\mathrm{n} \in \mathrm{I}$ and $\alpha=\sin ^{-1} \mathrm{k}$
(c) $\cos \theta=\cos \alpha: \theta=2 \mathrm{n} \pi \pm \alpha, \mathrm{n} \in \mathrm{I}$
(d) $\cos \theta=k$, where $-1 \leq k \leq 1$.
$\theta=2 \mathrm{n} \pi \pm \alpha$, where $\mathrm{n} \in \mathrm{I}$ and $\alpha=\cos ^{-1} \mathrm{k}$
(e) $\boldsymbol{\operatorname { t a n }} \theta=\boldsymbol{\operatorname { t a n }} \alpha: \theta=\mathrm{n} \pi+\alpha ; \mathrm{n} \in \mathrm{I}$
(f) $\boldsymbol{\operatorname { t a n }} \theta=\mathbf{k}, \theta=\mathrm{n} \pi+\alpha$, where $\mathrm{n} \in \mathrm{I}$ and $\alpha=\tan ^{-1} \mathrm{k}$
(g) $\sin ^{2} \theta=\sin ^{2} \alpha: \theta=n \pi \pm \alpha ; n \in I$
(h) $\cos ^{2} \theta=\cos ^{2} \alpha: \theta=\mathrm{n} \pi \pm \alpha ; \mathrm{n} \in \mathrm{I}$
(i) $\boldsymbol{\operatorname { t a n }}^{2} \theta=\boldsymbol{\operatorname { t a n }}^{2} \alpha: \theta=\mathrm{n} \pi \pm \alpha ; \mathrm{n} \in \mathrm{I}$
$\sin \alpha+\sin (\alpha+\beta)+\sin (\alpha+2 \beta)+\ldots \ldots .$. to $n$ terms
$=\frac{\sin \left[\alpha+\left(\frac{\mathrm{n}-1}{2}\right) \beta\right]\left[\sin \left(\frac{\mathrm{n} \beta}{2}\right)\right]}{\sin (\beta / 2)} ; \beta \neq 2 \mathrm{n} \pi$
$\cos \alpha+\cos (\alpha+\beta)+\cos (\alpha+2 \beta)+\ldots \ldots .$. to $n$ terms
$=\frac{\cos \left[\alpha+\left(\frac{\mathrm{n}-1}{2}\right) \beta\right]\left[\sin \left(\frac{\mathrm{n} \beta}{2}\right)\right]}{\sin \left(\frac{\beta}{2}\right)} ; \beta \neq 2 \mathrm{n} \pi$
$\tan \left(\frac{\mathrm{B}-\mathrm{C}}{2}\right)=\left(\frac{\mathrm{b}-\mathrm{c}}{\mathrm{b}+\mathrm{c}}\right) \cot \left(\frac{\mathrm{A}}{2}\right)$
$\sin \left(\frac{\mathrm{A}}{2}\right)=\sqrt{\frac{(\mathrm{s}-\mathrm{b})(\mathrm{s}-\mathrm{c})}{\mathrm{bc}}}$
$\tan \left(\frac{\mathrm{A}}{2}\right)=\sqrt{\frac{(\mathrm{s}-\mathrm{b})(\mathrm{s}-\mathrm{c})}{\mathrm{s}(\mathrm{s}-\mathrm{a})}}$
$\mathrm{R}=\frac{\mathrm{a}}{2 \sin \mathrm{~A}}=\frac{\mathrm{b}}{2 \sin \mathrm{~B}}=\frac{\mathrm{c}}{2 \sin \mathrm{C}}$
$R=\frac{a b c}{4 \Delta}$
$r=4 R \sin \left(\frac{A}{2}\right) \cdot \sin \left(\frac{B}{2}\right) \cdot \sin \left(\frac{C}{2}\right)$
$\mathrm{a}=\mathrm{c} \cos \mathrm{B}+\mathrm{b} \cos \mathrm{C}$
Maximum value of $\sin \theta+\mathrm{b} \cos \theta=\sqrt{a^{2}+b^{2}}$ and minimum
value of $\mathrm{a} \sin \theta+\mathrm{b} \cos \theta=-\sqrt{a^{2}+b^{2}}$

## INVERSE TRIGONOMETRIC FUNCTIONS

Properties of inverse trigonometric function
$\cdot \tan ^{-1} x+\tan ^{-1} y= \begin{cases}\tan ^{-1}\left(\frac{x+y}{1-x y}\right), & \text { if } x y<1 \\ \pi+\tan ^{-1}\left(\frac{x+y}{1-x y}\right), & \text { if } x>0, y>0 \\ \text { and } x y>1 \\ -\pi+\tan ^{-1}\left(\frac{x+y}{1-x y}\right), & \text { if } x<0, y<0 \\ \text { and } x y>1\end{cases}$
$\cdot \cdot \tan ^{-1} x-\tan ^{-1} y= \begin{cases}\tan ^{-1}\left(\frac{x-y}{1+x y}\right), & \text { if } x y>-1 \\ \pi+\tan ^{-1}\left(\frac{x-y}{1+x y}\right), & \text { if } x>0, y<0 \text { and } x y<-1 \\ -\pi+\tan ^{-1}\left(\frac{x-y}{1+x y}\right), & \text { if } x<0, y>0 \text { and } x y<-1\end{cases}$

- $\sin ^{-1} x+\sin ^{-1} y=$
$\left\{\begin{array}{cc}\sin ^{-1}\left\{x \sqrt{1-y^{2}}+y \sqrt{1-x^{2}}\right\}, & \begin{array}{c}\text { if }-1 \leq x, y \leq 1 \text { and } x^{2}+y^{2} \leq 1 \\ \text { or if } x y<0 \text { and } x^{2}+y^{2}>1\end{array} \\ \pi-\sin ^{-1}\left\{x \sqrt{1-y^{2}}+y \sqrt{1-x^{2}}\right\}, & \text { if } 0<x, y \leq 1 \\ \text { and } x^{2}+y^{2}>1\end{array}\right\}$
- $\cos ^{-1} x+\cos ^{-1} y=$
$\begin{cases}\cos ^{-1}\left\{x y-\sqrt{1-x^{2}} \sqrt{1-y^{2}}\right\} & \text { if }-1 \leq x, y \leq 1 \text { and } x+y \geq 0 \\ 2 \pi-\cos ^{-1}\left\{x y-\sqrt{1-x^{2}} \sqrt{1-y^{2}}\right\}, & \text { if }-1 \leq x, y \leq 1 \text { and } x+y \leq 0\end{cases}$
$2 \sin ^{-1} x= \begin{cases}\sin ^{-1}\left(2 x \sqrt{1-x^{2}}\right), & \text { if }-\frac{1}{\sqrt{2}} \leq x \leq \frac{1}{\sqrt{2}} \\ \pi-\sin ^{-1}\left(2 x \sqrt{1-x^{2}}\right), & \text { if } \frac{1}{\sqrt{2}} \leq x \leq 1 \\ -\pi-\sin ^{-1}\left(2 x \sqrt{1-x^{2}}\right), & \text { if }-1 \leq x \leq-\frac{1}{\sqrt{2}}\end{cases}$
$2 \tan ^{-1} x= \begin{cases}\tan ^{-1}\left(\frac{2 x}{1-x^{2}}\right), & \text { if }-1<x<1 \\ \pi+\tan ^{-1}\left(\frac{2 x}{1-x^{2}}\right), & \text { if } x>1 \\ -\pi+\tan ^{-1}\left(\frac{2 x}{1-x^{2}}\right), & \text { if } x<-1\end{cases}$

## QUADRATIG EQUATIONS AND INEQUALITIES

Roots of a Quadratic Equation : The roots of the quadratic equation are given by $x=\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a}$
Nature of roots : In Quadratic equation $a x^{2}+b x+c=0$. The term $b^{2}-4 a c$ is called discriminant of the equation. It is denoted by $\Delta$ or D .
(A) Suppose $a, b, c \in R$ and $a \neq 0$
(i) If $\mathrm{D}>0 \Rightarrow$ Roots are Real and unequal
(ii) If $\mathrm{D}=0 \Rightarrow$ Roots are Real and equal and each equal to - b/2a
(iii) IfD $<0 \Rightarrow$ Roots are imaginary and unequal or complex conjugate.
(B) Suppose $a, b, c \in Q$ and $a \neq 0$
(i) IfD $>0$ and $D$ is perfect square $\Rightarrow$ Roots are unequal and Rational
(ii) If $\mathrm{D}>0$ and D is not perfect square $\Rightarrow$ Roots are irrational and unequal.

## Condition for Common Root(s)

Let $\mathrm{ax}^{2}+\mathrm{bx}+\mathrm{c}=0$ and $\mathrm{dx}^{2}+\mathrm{ex}+\mathrm{f}=0$ have a common root $\alpha$ (say).
Condition for both the roots to be common is $\frac{a}{d}=\frac{b}{e}=\frac{c}{f}$
If $p+i q$ ( $p$ and $q$ being real) is a root of the quadratic equation, where $\mathrm{i}=\sqrt{-1}$, then $\mathrm{p}-\mathrm{iq}$ is also a root of the quadratic equation.
Every equation of $n^{\text {th }}$ degree $(\mathrm{n} \geq 1)$ has exactly n roots and if the equation has more than $n$ roots, it is an identity.

## COMPLEX NUMBERS

Exponential Form: If $z=x+i y$ is a complex number then its exponential form is $\mathrm{z}=\mathrm{re}^{\mathrm{i} \theta}$ where r is modulus and $\theta$ is amplitude of complex number.
(i) $\left|z_{1}\right|+\left|z_{2}\right| \geq\left|z_{1}+z_{2}\right|$; here equality holds when $\arg \left(z_{1} / z_{2}\right)=0$ i.e. $z_{1}$ and $z_{2}$ are parallel.
(ii) $\left|\left|z_{1}\right|-\left|z_{2}\right|\right| \leq\left|z_{1}-z_{2}\right|$; here equality holds when $\arg \left(z_{1} / z_{2}\right)=0$ i.e. $z_{1}$ and $z_{2}$ are parallel.
(iii) $\left|z_{1}+z_{2}\right|^{2}+\left|z_{1}-z_{2}\right|^{2}=2\left(\left|z_{1}\right|^{2}+\left|z_{2}\right|^{2}\right)$
$\arg \left(z_{1} z_{2}\right)=\theta_{1}+\theta_{2}=\arg \left(z_{1}\right)+\arg \left(z_{2}\right)$
$\arg \left(\frac{z_{1}}{z_{2}}\right)=\theta_{1}-\theta_{2}=\arg \left(z_{1}\right)-\arg \left(z_{2}\right)$
For any integer $k, i^{4 k}=1, i^{4 k+1}=i, i^{4 k+2}=-1, i^{4 k+3}=-i$
$\left|z-z_{1}\right|+\left|z-z_{2}\right|=\lambda$, represents an ellipse if
$\left|z_{1}-z_{2}\right|<\lambda$, having the points $z_{1}$ and $z_{2}$ as its foci. And if $\left|z_{1}-z_{2}\right|=\lambda$, then $z$ lies on a line segment connecting $z_{1}$ and $z_{2}$.
Properties of Cube Roots of Unity
(i) $1+\omega+\omega^{2}=0$
(ii) $\omega^{3}=1$
(iii) $1+\omega^{\mathrm{n}}+\omega^{2 \mathrm{n}}=3$ (if n is multiple of 3 )
(iv) $1+\omega^{\mathrm{n}}+\omega^{2 \mathrm{n}}=0$ (if n is not a multiple of 3 ).

## PERMUTATIONS AND COMBINATIONS

The number of permutations of $n$ different things, taken $r$ at a time, where repetition is allowed, is $\mathrm{n}^{\mathrm{r}}$.

## Selection of Objects with Repetition :

The total number of selections of $r$ things from $n$ different things when each thing may be repeated any number of times is ${ }^{n+r+1} C_{r}$

## Selection from distinct objects :

The number of ways (or combinations) of $n$ different things selecting at least one of them is ${ }^{n} \mathrm{C}_{1}+{ }^{\mathrm{n}} \mathrm{C}_{2}+{ }^{\mathrm{n}} \mathrm{C}_{3}+\ldots . .+{ }^{\mathrm{n}} \mathrm{C}_{\mathrm{n}}$ $=2^{\mathrm{n}}-1$. This can also be stated as the total number of combination of $n$ different things.
> Selection from identical objects:
The number of ways to select some or all out of $(p+q+r)$ things where $p$ are alike of first kind, $q$ are alike of second kind and $r$ are alike of third kind is
$(\mathrm{p}+1)(\mathrm{q}+1)(\mathrm{r}+1)-1$
Selection when both identical and distinct objects are present:
If out of $(p+q+r+t)$ things, $p$ are alike one kind, $q$ are alike of second kind, $r$ are alike of third kind and $t$ are different, then the total number of combinations is
$(p+1)(q+1)(r+1) 2^{t}-1$
> Circular permutations:
(a) Arrangements round a circular table :

The number of circular permutations of $n$ different things taken all at a time is $\frac{{ }^{n} P_{n}}{n}=(n-1)!$, if clockwise and anticlockwise orders are taken as different.
(b) Arrangements of beads or flowers (all different) around a circular necklace or garland:
The number of circular permutations of ' $n$ ' different things taken all at a time is $\frac{1}{2}(n-1)!$, if clockwise and anticlockwise orders are taken to be some.
Sum of numbers :
(a) For given $n$ different digits $a_{1}, a_{2}, a_{3} \ldots \ldots . a_{n}$ the sum of the digits in the unit place of all numbers formed (if numbers are not repeated) is $\left(a_{1}+a_{2}+a_{3}+\ldots .+a_{n}\right)(n-1)$ !
(b) Sum of the total numbers which can be formed with given $n$ different digits $a_{1}, a_{2}, \ldots \ldots \ldots . a_{n}$ is
$\left(\mathrm{a}_{1}+\mathrm{a}_{2}+\mathrm{a}_{3}+\ldots \ldots \ldots+\mathrm{a}_{\mathrm{n}}\right)(\mathrm{n}-1)!$ ! $(111 \ldots \ldots . . \mathrm{ntimes})$

## BINOMIAL THEOREM

Greatest binomial coefficients : In a binomial expansion binomial coefficients of the middle terms are called as greatest binomial coefficients.
(a) Ifn is even: When $r=\frac{n}{2}$ i.e. ${ }^{n} C_{n 2}$ takes maximum value.
(b) If $n$ is odd : $r=\frac{n-1}{2}$ or $\frac{n+1}{2}$
i.e. ${ }^{\mathrm{n}} \mathrm{C}_{\frac{\mathrm{n}-1}{2}}={ }^{\mathrm{n}} \mathrm{C}_{\frac{\mathrm{n}+1}{}}$ and take maximum value.

Important Expansions :
If $|\mathrm{x}|<1$ and $\mathrm{n} \in \mathrm{Q}$ but $\mathrm{n} \notin \mathrm{N}$, then
(a) $(1+\mathrm{x})^{\mathrm{n}}=1+\mathrm{nx}+\frac{\mathrm{n}(\mathrm{n}-1)}{2!} \mathrm{x}^{2}$

$$
+\ldots \ldots+\frac{n(n-1) \ldots . .(n-r+1)}{r!} x^{r}+\ldots \ldots .
$$

(b)

$+\ldots \ldots+\frac{\mathrm{n}(\mathrm{n}-1) \ldots . .(\mathrm{n}-\mathrm{r}+1)}{\mathrm{r}!}(-\mathrm{x})^{\mathrm{r}}+\ldots \ldots .$.

## SEQUENCE AND SERIES

## Properties related to A.P. :

(i) Common difference of AP is given by $\mathrm{d}=\mathrm{S}_{2}-2 \mathrm{~S}_{1}$ where $S_{2}$ is sum of first two terms and $S_{1}$ is sum of first term.
(ii) If for an AP sum of $p$ terms is $q$, sum of $q$ terms is $p$, then $\operatorname{sum}$ of $(p+q)$ term is $(p+q)$.
(iii) In an A.P. the sum of terms equidistant from the beginning and end is constant and equal to sum of first and last terms.
(iv) If terms $a_{1}, a_{2}, \ldots, a_{n}, a_{n+1}, \ldots, a_{2 n+1}$ are in A.P., then sum of these terms will be equal to $(2 n+1) a_{n+1}$.
(v) If for an A.P. sum of $p$ terms is equal to sum of $q$ terms then sum of $(p+q)$ terms is zero
(vi) Sum of $n$ AM's inserted between $a$ and $b$ is equal to $n$ times the single $A M$ between $a$ and $b$ i.e. $\sum_{r=1}^{n} A_{r}=n A$ where $\mathrm{A}=\frac{\mathrm{a}+\mathrm{b}}{2}$
The geometric mean (G.M.) of any two positive numbers a and $b$ is given by $\sqrt{a b}$ i.e., the sequence $a, G, b$ is G.P.
n GM's between two given numbers: If in between two numbers 'a' and ' $b$ ', we have to insert $n \mathrm{GM} \mathrm{G}_{1}, \mathrm{G}_{2}, \ldots \ldots \ldots . \mathrm{G}_{\mathrm{n}}$ then $a_{1}, G_{1}, G_{2}, \ldots \ldots . . G_{n}$, b will be in G.P.
The series consist of $(\mathrm{n}+2)$ terms and the last term is b and first term is a.
$\Rightarrow \mathrm{ar}^{\mathrm{n}+2-1}=\mathrm{b} \Rightarrow \mathrm{r}=\left(\frac{\mathrm{b}}{\mathrm{a}}\right)^{\frac{1}{\mathrm{n}+1}}$
$\mathrm{G}_{1}=\mathrm{ar}, \mathrm{G}_{2}=\operatorname{ar}^{2} \ldots \ldots . \mathrm{G}_{\mathrm{n}}=\operatorname{ar}^{\mathrm{n}}$ or $\mathrm{G}_{\mathrm{n}}=\mathrm{b} / \mathrm{r}$
Use of inequalities in progression :
(a) Arithmetic Mean $\geq$ Geometric Mean
(b) Geometric Mean $\geq$ Harmonic Mean :

$$
\mathrm{A} \geq \mathrm{G} \geq \mathrm{H}
$$

## STRAIGHT LINES

An acute angle (say $\theta$ ) between lines $L_{1}$ and $L_{2}$ with slopes $m_{1}$ and $m_{2}$ is given by $\tan \theta=\left|\frac{m_{2}-m_{2}}{1+m_{1} m_{2}}\right|, 1+m_{1} m_{2} \neq 0$
Three points $\mathrm{A}, \mathrm{B}$ and C are collinear, if and only if slope of $\mathrm{AB}=$ slope of BC .
The equation of the line having normal distance from origin is p and angle between normal and the positive x -axis is $\omega$, is given by $\mathrm{x} \cos \omega+\mathrm{y} \sin \omega=\mathrm{p}$.

## Co-ordinate of some particular points :

Let $\mathrm{A}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right), \mathrm{B}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ and $\mathrm{C}\left(\mathrm{x}_{3}, \mathrm{y}_{3}\right)$ are vertices of any triangle ABC , then
Incentre: Co-ordinates of incentre

$$
\left(\frac{a x_{1}+b x_{2}+c x_{3}}{a+b+c}, \frac{a y_{1}+b y_{2}+c y_{3}}{a+b+c}\right)
$$

where $a, b, c$ are the sides of triangle $A B C$

Area of a triangle : $\operatorname{Let}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right),\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ and $\left(\mathrm{x}_{3}, \mathrm{y}_{3}\right)$
respectively be the coordinates of the vertices $\mathrm{A}, \mathrm{B}, \mathrm{C}$ of a triangle $A B C$. Then the area of triangle $A B C$, is

$$
\begin{aligned}
& \frac{1}{2}\left[\mathrm{x}_{1}\left(\mathrm{y}_{2}-\mathrm{y}_{3}\right)+\mathrm{x}_{2}\left(\mathrm{y}_{3}-\mathrm{y}_{1}\right)+\mathrm{x}_{3}\left(\mathrm{y}_{1}-\mathrm{y}_{2}\right)\right] \\
& =\frac{1}{2}\left|\begin{array}{lll}
\mathrm{x}_{1} & \mathrm{y}_{1} & 1 \\
\mathrm{x}_{2} & \mathrm{y}_{2} & 1 \\
\mathrm{x}_{3} & \mathrm{y}_{3} & 1
\end{array}\right|
\end{aligned}
$$

## CONIC SECTIONS

Condition of Tangency: Circle
$x^{2}+y^{2}=a^{2}$ will touch the line.
$y=m x+c$ if $c= \pm a \sqrt{1+m^{2}}$
Pair of Tangents : From a given point $\mathrm{P}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)$ two tangents $P Q$ and $P R$ can be drawn to the circle
$S=x^{2}+y^{2}+2 g x+2 f y+c=0$.
Their combined equation is $\mathrm{SS}_{1}=\mathrm{T}^{2}$.
Condition of Orthogonality : If the angle of intersection of the two circle is a right angle $\left(\theta=90^{\circ}\right)$ then such circle are called Orthogonal circle and conditions for their orthogonality is $2 \mathrm{~g}_{1} \mathrm{~g}_{2}+2 \mathrm{f}_{1} \mathrm{f}_{2}=\mathrm{c}_{1}+\mathrm{c}_{2}$
Tangent to the parabola :
Condition of Tangency : If the line $\mathrm{y}=\mathrm{mx}+\mathrm{c}$ touches a parabola $y^{2}=4 a x$ then $c=a / m$
Tangent to the Ellipse:
Condition of tangency and point of contact :
The condition for the line $y=m x+c$ to be a tangent to the ellipse $\frac{x^{2}}{a^{2}}+\frac{y^{2}}{b^{2}}=1$ is that $c^{2}=a^{2} m^{2}+b^{2}$ and the coordinates of the points of contact are $\left( \pm \frac{a^{2} m}{\sqrt{a^{2} \mathrm{~m}^{2}+\mathrm{b}^{2}}}, \mp \frac{\mathrm{~b}^{2}}{\sqrt{\mathrm{a}^{2} \mathrm{~m}^{2}+\mathrm{b}^{2}}}\right)$

## Normal to the ellipse

(i) Point Form : The equation of the normal to the ellipse

$$
\begin{aligned}
& \frac{x^{2}}{a^{2}}+\frac{y^{2}}{b^{2}}=1 \text { at the point }\left(x_{1}, y_{1}\right) \text { is } \frac{a^{2} x}{x_{1}}-\frac{b^{2} y}{y_{1}} \\
& =a^{2}-b^{2}
\end{aligned}
$$

(ii) Parametric Form : The equation of the normal to the ellipse $\frac{x^{2}}{a^{2}}+\frac{y^{2}}{b^{2}}=1$ at the point $(a \cos \theta, b \sin \theta)$ is $a x \sec \theta-b y \operatorname{cosec} \theta=a^{2}-b^{2}$
Tangent to the hyperbola :
Condition for tangency and points of contact : The condition for the line $\mathrm{y}=\mathrm{mx}+\mathrm{c}$ to be a tangent to the hyperbola $\frac{x^{2}}{a^{2}}-\frac{y^{2}}{b^{2}}=1$ is that $c^{2}=a^{2} m^{2}-b^{2}$ and the coordinates of the points of contact are $\left( \pm \frac{\mathrm{a}^{2} \mathrm{~m}}{\sqrt{\mathrm{a}^{2} \mathrm{~m}^{2}-\mathrm{b}^{2}}}, \pm \frac{\mathrm{b}^{2}}{\sqrt{\mathrm{a}^{2} \mathrm{~m}^{2}-\mathrm{b}^{2}}}\right)$

## Chord of contact :

The equation of chord of contact of tangent drawn from a point $P\left(x_{1}, y_{1}\right)$ to the hyperbola $\frac{x^{2}}{a^{2}}-\frac{y^{2}}{b^{2}}=1$ is $T=0$
where $\mathrm{T} \equiv \frac{\mathrm{xx}_{1}}{\mathrm{a}^{2}}-\frac{\mathrm{yy}_{1}}{\mathrm{~b}^{2}}-1$

## Equation of normal in different forms :

Point Form : The equation of the normal to the hyperbola
$\frac{x^{2}}{a^{2}}-\frac{y^{2}}{b^{2}}=1$ at the point $\left(x_{1}, y_{1}\right)$ is $\frac{a^{2} x}{x_{1}}+\frac{b^{2} y}{y_{1}}=a^{2}+b^{2}$

## THREE DIMENSIONAL GEOMETRY

Slope Form : The equation of normal to the hyperbola $\frac{x^{2}}{a^{2}}-\frac{y^{2}}{b^{2}}=1$ in terms of slope ' $m$ ' is $y=m x \pm \frac{m\left(a^{2}+b^{2}\right)}{\sqrt{a^{2}-b^{2} m^{2}}}$

## Conditions of Parallelism and Perpendicularity of Two

 Lines:Case-I: When dc's of two lines AB and CD , say $\ell_{1}, \mathrm{~m}_{1}, \mathrm{n}_{1}$ and $\ell_{2}, \mathrm{~m}_{2}, \mathrm{n}_{2}$ are known.

$$
\begin{aligned}
& \mathrm{AB} \| \mathrm{CD} \Leftrightarrow \ell_{1}=\ell_{2}, \mathrm{~m}_{1}=\mathrm{m}_{2}, \mathrm{n}_{1}=\mathrm{n}_{2} \\
& \mathrm{AB} \perp \mathrm{CD} \Leftrightarrow \ell_{1} \ell_{2}+\mathrm{m}_{1} \mathrm{~m}_{2}+\mathrm{n}_{1} \mathrm{n}_{2}=0
\end{aligned}
$$

Case-II : When dr's of two lines AB and CD, say $a_{1}, b_{1} c_{1}$ and $\mathrm{a}_{2}, \mathrm{~b}_{2}, \mathrm{c}_{2}$ are known

$$
\mathrm{AB} \| \mathrm{CD} \Leftrightarrow \frac{\mathrm{a}_{1}}{\mathrm{a}_{2}}=\frac{\mathrm{b}_{1}}{\mathrm{~b}_{2}}=\frac{\mathrm{c}_{1}}{\mathrm{c}_{2}}
$$

$$
\mathrm{AB} \perp \mathrm{CD} \Leftrightarrow \mathrm{a}_{1} \mathrm{a}_{2}+\mathrm{b}_{1} \mathrm{~b}_{2}+\mathrm{c}_{1} \mathrm{c}_{2}=0
$$

If $\ell_{1}, \mathrm{~m}_{1}, \mathrm{n}_{1}$ and $\ell_{2}, \mathrm{~m}_{2}, \mathrm{n}_{2}$ are the direction cosines of two lines; and $\theta$ is the acute angle between the two lines; then $\cos \theta=\left|\ell_{1} \ell_{2}+m_{1} m_{2}+n_{1} n_{2}\right|$.
Equation of a line through a point $\left(\mathrm{x}_{1}, \mathrm{y}_{1}, \mathrm{z}_{1}\right)$ and having direction cosines $\ell, m, n$ is $\frac{x-x_{1}}{\ell}=\frac{y-y_{1}}{m}=\frac{z-z_{1}}{n}$

Shortest distance between $\overrightarrow{\mathrm{r}}=\vec{a}_{1}+\lambda \vec{b}_{1}$ and $\overrightarrow{\mathrm{r}}=\vec{a}_{2}+\mu \overrightarrow{\mathrm{b}}_{2}$
is $\left|\frac{\left(\overrightarrow{\mathrm{b}}_{1} \times \overrightarrow{\mathrm{b}}_{2}\right) \cdot\left(\overrightarrow{\mathrm{a}}_{2}-\overrightarrow{\mathrm{a}}_{1}\right)}{\left|\overrightarrow{\mathrm{b}}_{1} \times \overrightarrow{\mathrm{b}}_{2}\right|}\right|$
Let the two lines be
$\frac{x-\alpha_{1}}{\ell_{1}}=\frac{y-\beta_{1}}{m_{1}}=\frac{z-\gamma_{1}}{n_{1}}$
and $\frac{x-\alpha_{2}}{\ell_{2}}=\frac{y-\beta_{2}}{m_{2}}=\frac{z-\gamma_{2}}{n_{2}}$
These lines will coplanar if

The plane containing the two lines is

$$
\left|\begin{array}{ccc}
\mathrm{x}-\alpha_{1} & \mathrm{y}-\beta_{1} & \mathrm{z}-\gamma_{1} \\
\ell_{1} & \mathrm{~m}_{1} & \mathrm{n}_{1} \\
\ell_{2} & \mathrm{~m}_{2} & \mathrm{n}_{2}
\end{array}\right|=0
$$

$>$ The equation of a plane through a point whose position vector is $\vec{a}$ and perpendicular to the vector $\vec{N}$ is
$(\overrightarrow{\mathrm{r}}-\overrightarrow{\mathrm{a}}) \cdot \overrightarrow{\mathrm{N}}=0$
$>$ Vector equation of a plane that passes through the intersection of planes $\overrightarrow{\mathrm{r}} . \vec{n}_{1}=\mathrm{d}_{1}$ and $\overrightarrow{\mathrm{r}} . \overrightarrow{\mathrm{n}}_{2}=\mathrm{d}_{2}$ is $\overrightarrow{\mathrm{r}} .\left(\overrightarrow{\mathrm{n}}_{1}+\lambda \overrightarrow{\mathrm{n}}_{2}\right)=\mathrm{d}_{1}+\lambda \mathrm{d}_{2}$, where $\lambda$ is any nonzero constant.
Two planes $\overrightarrow{\mathrm{r}}=\overrightarrow{\mathrm{a}}_{1}+\lambda \overrightarrow{\mathrm{b}}_{1}$ and $\overrightarrow{\mathrm{r}}=\overrightarrow{\mathrm{a}}_{2}+\mu \overrightarrow{\mathrm{b}}_{2}$ are coplanar if $\left(\vec{a}_{2}-\vec{a}_{1}\right)+\left(\vec{b}_{1} \times \vec{b}_{2}\right)=0$

## DIFFERENTIAL GALCULUS

## Existence of Limit :

$$
\lim _{x \rightarrow a} f(x) \text { exists } \Rightarrow \lim _{x \rightarrow a^{-}} f(x)=\lim _{x \rightarrow a^{+}} f(x)=\ell
$$

Where $\ell$ is called the limit of the function
(i) If $f(x) \leq g(x)$ for every $x$ in the deleted nbd of a, then $\lim _{x \rightarrow \mathrm{a}} \mathrm{f}(\mathrm{x}) \leq \lim _{\mathrm{x} \rightarrow \mathrm{a}} \mathrm{g}(\mathrm{x})$
(ii) If $f(x) \leq g(x) \leq h$ (x) for every $x$ in the deleted nbd of a and $\lim _{x \rightarrow \mathrm{a}} \mathrm{f}(\mathrm{x})=\ell=\lim _{\mathrm{x} \rightarrow \mathrm{a}} \mathrm{h}(\mathrm{x})$ then $\lim _{\mathrm{x} \rightarrow \mathrm{a}} \mathrm{g}(\mathrm{x})=\ell$
(iii) $\lim _{x \rightarrow a} \operatorname{fog}(x)=f\left(\lim _{x \rightarrow a} g(x)\right)=f(m)$ where $\lim _{x \rightarrow a} g(x)=m$
(iv) If $\lim _{x \rightarrow a} f(x)=+\infty$ or $-\infty$, then $\lim _{x \rightarrow a} \frac{1}{f(x)}=0$

## CONTINUITYANDDIFFERENTIABILITY OFFUNCTIONS

A function $f(x)$ is said to be continuous at a point $x=a$ if

$$
\lim _{x \rightarrow a^{+}} f(x)=\lim _{x \rightarrow a^{-}} f(x)=f(a)
$$

## Discontinuous Functions :

(a) Removable Discontinuity: A function f is said to have removable discontinuity at $x=$ a if $\lim _{x \rightarrow a^{-}} f(x)=\lim _{x \rightarrow a^{+}} f(x)$ but their common value is not equal to $f(a)$.
(b) Discontinuity of the first kind: A function f is said to have a discontinuity of the first kind at $x=a$ if
$\lim _{x \rightarrow a^{-}} f(x)$ and $\lim _{x \rightarrow a^{+}} f(x)$ both exist but are not equal.
(c) Discontinuity of second kind: A function $f$ is said to have a discontinuity of the second kind at $x=a$ if neither

$$
\lim _{x \rightarrow a^{-}} f(x) \text { nor } \lim _{x \rightarrow a^{+}} f(x) \text { exists. }
$$

Similarly, if $\lim _{x \rightarrow a^{+}} f(x)$ does not exist, then $f$ is said to have discontinuity of the second kind from the right at $\mathrm{x}=\mathrm{a}$.

## For a function f :

Differentiability $\Rightarrow$ Continuity;
Continuity $\Rightarrow$ derivability
Not derivibaility $\nRightarrow$ discontinuous ;
But discontinuity $\Rightarrow$ Non derivability
Differentiation of infinite series:
(i) If $y=\sqrt{f(x)+\sqrt{f(x)+\sqrt{f(x)+\ldots \ldots . . \infty}}}$
$\Rightarrow \quad y=\sqrt{f(x)+y} \Rightarrow y^{2}=f(x)+y$
$2 y \frac{d y}{d x}=f^{\prime}(x)+\frac{d y}{d x} \quad \therefore \frac{d y}{d x}=\frac{f^{\prime}(x)}{2 y-1}$
(ii) If $y=f(x)^{f(x)^{f(x)} \cdots \infty}$ then $y=f(x)^{y}$.
$\therefore \quad \log \mathrm{y}=\mathrm{y} \log [\mathrm{f}(\mathrm{x})]$
$\frac{1}{y} \frac{d y}{d x}=\frac{y^{\prime} \cdot f^{\prime}(x)}{f(x)}+\log f(x) \cdot\left(\frac{d y}{d x}\right)$
$\therefore \quad \frac{d y}{d x}=\frac{y^{2} f^{\prime}(x)}{f(x)[1-y \log f(x)]}$
(iii) If $y=f(x)+\frac{1}{f(x)}+\frac{1}{f(x)}+\frac{1}{f(x)}^{\text {... then } \frac{d y}{d x}}=\frac{y f^{\prime}(x)}{2 y-f(x)}$

## DIFFERENTIATION AND <br> APPLICATION

Interpretation of the Derivative : If $y=f(x)$ then, $m=f^{\prime}(a)$ is the slope of the tangent line to $y=f(x)$ at $x=a$
Increasing/Decreasing :
(i) If $^{\prime}(x)>0$ for all $x$ in an interval I then $f(x)$ is increasing on the interval I.
(ii) $\operatorname{Iff}^{\prime}(\mathrm{x})<0$ for all x in an interval I then $\mathrm{f}(\mathrm{x})$ is decreasing on the interval I.
(iii) If $\mathrm{f}^{\prime}(\mathrm{x})=0$ for all x in an interval I then $\mathrm{f}(\mathrm{x})$ is constant on the interval I.
Test of Local Maxima and Minima -
First Derivative Test-Let fbe a differentiable function defined on an open interval $I$ and $c \in I$ be anypoint. fhas a local maxima or a localminima at $\mathrm{x}=\mathrm{c}, \mathrm{f}^{\prime}(\mathrm{c})=0$.
Put $\frac{d y}{d x}=0$ and solve this equation for $x$. Let $c_{1}, c_{2} \ldots \ldots . . c_{n}$ be the roots of this.
If $\frac{d y}{d x}$ changes sign from $+v e$ to $-v e$ as $x$ increases through $c_{1}$ then the function attains a local max at $x=c_{1}$
If $\frac{d y}{d x}$ changes its sign from $-v e$ to $+v e$ as $x$ increases through $\mathrm{c}_{1}$ then the function attains a local minimum at $\mathrm{x}=\mathrm{c}_{1}$

If $\frac{d y}{d x}$ does not changes sign as increases through $c_{1}$ then $x=c_{1}$ is neither a point of local max ${ }^{m}$ nor a point of local $\min ^{\mathrm{m}}$. In this case x is a point of inflexion.

## Rate of change of variable :

The value of $\frac{d y}{d x}$ at $x=x_{0}$ i.e. $\left(\frac{d y}{d x}\right)_{x=x_{0}}$ represents the rate of change of $y$ with respect to $x$ at $x=x_{0}$
If $x=\phi(t)$ and $y=\psi(t)$, then $\frac{d y}{d x}=\frac{d y / d t}{d x / d t}$, provided that $\frac{d x}{d t} \neq 0$ Thus, the rate of change of $y$ with respect to $x$ can be calculated by using the rate of change of $y$ and that of $x$ each with respect to $t$.
Length of Sub-tangent $=\left|y \frac{d x}{d y}\right| ;$ Sub-normal $=\left|y \frac{d y}{d x}\right| ;$
Length of tangent $=\left|y \sqrt{\left\{1+\left(\frac{d x}{d y}\right)^{2}\right\}}\right|$
Length of normal $=\left|y\left\{1+\left(\frac{d y}{d x}\right)^{2}\right\}\right|$
Equations of tangent and normal : The equation of the tangent at $P\left(x_{1}, y_{1}\right)$ to the curve $y=f(x)$ is $y-y_{1}$ $=\left(\frac{d y}{d x}\right)_{P}\left(x-x_{1}\right)$. The equation of the normal at $P\left(x_{1}, y_{1}\right)$ to the curve $y=f(x)$ is $y-y_{1}=-\frac{1}{\left(\frac{d y}{d x}\right)_{P}}\left(x-x_{1}\right)$

## INTEGRAL CALCULUS

## Two standard forms of integral :

$\int e^{x}\left[f(x)+f^{\prime}(x) \quad d x=e^{x} f(x)+c\right.$
$\Rightarrow \int e^{x}\left[f(x)+f^{\prime}(x)\right] d x=\int e^{x} f(x) d x+\int e^{x} f^{\prime}(x) d x$
$=e^{x} f(x)-\int e^{x} f^{\prime}(x) d x+\int e^{x} f^{\prime}(x)$
(on integrating by parts) $=e^{x} f(x)+c$
Table shows the partial fractions corresponding to different type of rational functions :
S. Form of rational

No. function

## Form of partial fraction

1. $\frac{p x+q}{(x-a)(x-b)}$
$\frac{A}{(x-a)}+\frac{B}{(x-b)}$
2. $\frac{p x^{2}+q x+r}{(x-a)^{2}(x-b)} \quad \frac{A}{(x-a)}+\frac{B}{(x-a)^{2}}+\frac{C}{(x-b)}$
3. $\frac{p x^{2}+q x+r}{(x-a)\left(x^{2}+b x+c\right)}$

$$
\frac{A}{(x-a)}+\frac{B x+C}{x^{2}+b x+C}
$$

Leibnitz rule : $\frac{d}{d x} \int_{f(x)}^{g(x)} F(t) d t=g^{\prime}(x) F(g(x))-f^{\prime}(x) F(f(x))$
If a series can be put in the form
$\frac{1}{n} \sum_{r=0}^{r=n-1} f\left(\frac{r}{n}\right)$ or $\frac{1}{n} \sum_{r=1}^{r=n} f\left(\frac{r}{n}\right)$, then its limit as $n \rightarrow \infty$

Area between curves :
$y=f(x) \Rightarrow A=\int_{a}^{b}[$ upper function $]-[$ lower function $] d x$
and $x=f(y) \Rightarrow A=\int_{c}^{d}[$ right function $]-[$ left function $] d y$
If the curves intersect then the area of each portion must be found individually.
$>$ Symmetrical area : If the curve is symmetrical about a coordinate axis (or a line or origin), then we find the area of one symmetrical portion and multiply it by the number of symmetrical portion to get the required area.

## PROBABILITY

Probability of an event: For a finite sample space with equally likely outcomes Probability of an event is
$P(A)=\frac{n(A)}{n(S)}$, where $n(A)=$ number of elements in the set $A, n(S)=$ number of elements in the set $S$.
Theorem of total probability : Let $\left\{\mathrm{E}_{1}, \mathrm{E}_{2}, \ldots, \mathrm{E}_{n}\right\}$ be a partition of a sample space and suppose that each of $E_{1}, E_{2}, \ldots, E_{n}$ has nonzero probability. Let A be any event associated with S , then
$\mathrm{P}(\mathrm{A})=\mathrm{P}\left(\mathrm{E}_{1}\right) \mathrm{P}\left(\mathrm{A} \mid \mathrm{E}_{1}\right)+\mathrm{P}\left(\mathrm{E}_{2}\right) \mathrm{P}\left(\mathrm{A} \mid \mathrm{E}_{2}\right)+\ldots$

$$
+P\left(E_{n}\right) P\left(A \mid E_{n}\right)
$$

Bayes' theorem: If $E_{1}, E_{2}, \ldots, E_{n}$ are events which constitute a partition of sample space $S$, i.e. $E_{1}, E_{2}, \ldots, E_{n}$ are pairwise disjoint and $E_{1} \cup E_{2} \cup \ldots \cup E_{n}=S$ and $A$ be any event with nonzero probability, then

$$
P\left(E_{i} \mid A\right)=\frac{P\left(E_{i}\right) P\left(A \mid E_{i}\right)}{\sum_{j=1}^{n} P\left(E_{j}\right) P\left(A \mid E_{j}\right)}
$$

Let $X$ be a random variable whose possible values $x_{1}, x_{2}, x_{3}$, $\ldots, \mathrm{x}_{\mathrm{n}}$ occur with probabilities $\mathrm{p}_{1}, \mathrm{p}_{2}, \mathrm{p}_{3}, \ldots \mathrm{p}_{\mathrm{n}}$ respectively.
The mean of $X$, denoted by $\mu$, is the number $\sum_{i=1}^{n} x_{i} p_{i}$
The mean of a random variable $X$ is also called the expectation of X , denoted by $\mathrm{E}(\mathrm{X})$.
>
Trials of a random experiment are called Bernoulli trials, if they satisfy the following conditions :
(a) There should be a finite number of trials. (b) The trials should be independent. (c) Each trial has exactly two outcomes : success or failure. (d) The probability of success remains the same in each trial.
For Binomial distribution $B(n, p)$,
$P(X=x)={ }^{n} C_{x} q^{n-x} p^{x}, x=0,1, \ldots, n(q=1-p)$

## MATRICES

Properties of Transpose
(i) $\left(\mathrm{A}^{\mathrm{T}}\right)^{\mathrm{T}}=\mathrm{A}$
(ii) $(\mathrm{A} \pm \mathrm{B})^{\mathrm{T}}=\mathrm{A}^{\mathrm{T}} \pm \mathrm{B}^{\mathrm{T}}$
(iii) $(\mathrm{AB})^{\mathrm{T}}=\mathrm{B}^{\mathrm{T}} \mathrm{A}^{\mathrm{T}} \quad$ (iv) $(\mathrm{kA})^{\mathrm{T}}=\mathrm{k}(\mathrm{A})^{\mathrm{T}}$
(v) $I^{\mathrm{T}}=\mathrm{I}\left(\right.$ vi) $\operatorname{tr}(\mathrm{A})=\operatorname{tr}(\mathrm{A})^{\mathrm{T}}$
(vii) $\left(\mathrm{A}_{1} \mathrm{~A}_{2} \mathrm{~A}_{3} \ldots . . \mathrm{A}_{\mathrm{n}-1} \mathrm{~A}_{\mathrm{n}}\right)^{\mathrm{T}}=\mathrm{A}_{\mathrm{n}}{ }^{\mathrm{T}} \mathrm{A}_{\mathrm{n}-1}{ }^{\mathrm{T}} \ldots . . \mathrm{A}_{3}{ }^{\mathrm{T}} \mathrm{A}_{2}{ }^{\mathrm{T}} \mathrm{A}_{1}{ }^{\mathrm{T}}$
$>$ Symmetric Matrix : A square matrix $A=\left[a_{i j}\right]$ is called symmetric matrix if

$$
\mathrm{a}_{\mathrm{ij}}=\mathrm{a}_{\mathrm{ji}} \text { for all } \mathrm{i}, \mathrm{j} \text { or } \mathrm{A}^{\mathrm{T}}=\mathrm{A}
$$

- Skew-Symmetric Matrix : A square matrix $A=\left[a_{i j}\right]$ is called skew-symmetric matrix if

$$
\begin{aligned}
& \mathrm{a}_{\mathrm{ij}}=-\mathrm{a}_{\mathrm{ji}} \text { for all } \mathrm{i}, \mathrm{j} \text { or } \mathrm{A}^{\mathrm{T}}=-\mathrm{A} \\
& \text { so everv square matrix } \mathrm{A} \text { can } \mathrm{b}
\end{aligned}
$$

Also every square matrix A can be uniquely expressed as a sum of a symmetric and skew-symmetric matrix.
Differentiation of a matrix : If $A=\left[\begin{array}{ll}f(x) & g(x) \\ h(x) & \ell(x)\end{array}\right]$ then $\frac{d A}{d x}=\left[\begin{array}{ll}f^{\prime}(x) & g^{\prime}(x) \\ h^{\prime}(x) & \ell^{\prime}(x)\end{array}\right]$ is a differentiation of Matrix A

## DETERMINANTS

Properties of adjoint matrix : If $\mathrm{A}, \mathrm{B}$ are square matrices of order $n$ and $I_{n}$ is corresponding unit matrix, then
(i) $\mathrm{A}(\operatorname{adj} . \mathrm{A})=|\mathrm{A}| \mathrm{I}_{\mathrm{n}}=(\operatorname{adj} \mathrm{A}) \mathrm{A}$
(ii) $|\operatorname{adj} \mathrm{A}|=|\mathrm{A}|^{\mathrm{n}-1}$
(Thus $A(\operatorname{adj} A)$ is always a scalar matrix)
(iii) $\operatorname{adj}(\operatorname{adj} \mathrm{A})=|\mathrm{A}|^{\mathrm{n}-2} \mathrm{~A}$
(iv) $|\operatorname{adj}(\operatorname{adj} \mathrm{A})|=|\mathrm{A}|^{(\mathrm{n}-1)^{2}}$
(v) $\operatorname{adj}\left(\mathrm{A}^{\mathrm{T}}\right)=(\operatorname{adj} \mathrm{A})^{\mathrm{T}}$
(vi) $\operatorname{adj}(A B)=(\operatorname{adj} B)(\operatorname{adj} A)$
(vii) $\operatorname{adj}\left(\mathrm{A}^{\mathrm{m}}\right)=(\operatorname{adj} \mathrm{A})^{\mathrm{m}}, \mathrm{m} \in \mathrm{N}$
(viii) $\operatorname{adj}(\mathrm{kA})=\mathrm{k}^{\mathrm{n}-1}$ (adj. A$), \mathrm{k} \in \mathrm{R}$
(ix) $\operatorname{adj}\left(I_{n}\right)=I_{n}$
$>$ Properties of Inverse Matrix : Let A and B are two invertible matrices of the same order, then
(i) $\quad\left(\mathrm{A}^{T}\right)^{-1}=\left(\mathrm{A}^{-1}\right)^{\mathrm{T}}$
(ii) $(\mathrm{AB})^{-1}=\mathrm{B}^{-1} \mathrm{~A}^{-1}$
(iii) $\left(\mathrm{A}^{\mathrm{k}}\right)^{-1}=\left(\mathrm{A}^{-1}\right)^{\mathrm{k}}, \mathrm{k} \in \mathrm{N}$
(iv) $\operatorname{adj}\left(\mathrm{A}^{-1}\right)=(\operatorname{adj} \mathrm{A})^{-1}$
(v) $\left(\mathrm{A}^{-1}\right)^{-1}=\mathrm{A}$
(vi) $\left|\mathrm{A}^{-1}\right|=\frac{1}{|\mathrm{~A}|}=|\mathrm{A}|^{-1}$
(vii) IfA $=\operatorname{diag}\left(a_{1}, a_{2}, \ldots, a_{n}\right)$, then
$\mathrm{A}^{-1}=\operatorname{diag}\left(\mathrm{a}_{1}^{-1}, \mathrm{a}_{2}^{-1}, \ldots \ldots \ldots \mathrm{a}_{\mathrm{n}}^{-1}\right)$
(viii) $A$ is symmetric matrix $\Rightarrow A^{-1}$ is symmetric matrix.

Rank of a Matrix : A number $r$ is said to be the rank of a $\mathrm{m} \times \mathrm{n}$ matrix A if
(a) Every square sub matrix of order $(\mathrm{r}+1)$ or more is singular and (b) There exists at least one square submatrix of order $r$ which is non-singular.
Thus, the rank of matrix is the order of the highest order non-singular sub matrix.
Using Crammer's rule of determinant we get
$\frac{x}{D_{1}}=\frac{y}{D_{2}}=\frac{z}{D_{3}}=\frac{1}{D}$ i. e. $x=\frac{D_{1}}{D}, y=\frac{D_{2}}{D}, z=\frac{D_{3}}{D}$
Case-I : If $\Delta \neq 0$
Then $\mathrm{x}=\frac{\mathrm{D}_{1}}{\mathrm{D}}, \mathrm{y}=\frac{\mathrm{D}_{2}}{\mathrm{D}}, \mathrm{z}=\frac{\mathrm{D}_{3}}{\mathrm{D}}$
$\therefore$ The system is consistent and has unique solutions.
Case-II if $\Delta=0$ and
(i) If at least one of $\Delta_{1}, \Delta_{2}, \Delta_{3}$ is not zero then the system of equations a inconsistent i.e. has no solution.
(ii) If $\mathrm{d}_{1}=\mathrm{d}_{2}=\mathrm{d}_{3}=0$ or $\Delta_{1}, \Delta_{2}, \Delta_{3}$ are all zero then the system of equations has infinitely many solutions.

## VECTOR ALGEBRA

Given vectors $x_{1} \vec{a}+y_{1} \vec{b}+z_{1} \vec{c}, \quad x_{2} \vec{a}+y_{2} \vec{b}+z_{2} \vec{c}$, $\mathrm{x}_{3} \overrightarrow{\mathrm{a}}+\mathrm{y}_{3} \overrightarrow{\mathrm{~b}}+\mathrm{z}_{3} \overrightarrow{\mathrm{c}}$, where $\overrightarrow{\mathrm{a}}, \overrightarrow{\mathrm{b}}, \overrightarrow{\mathrm{c}}$ are non-coplanar vectors,

(a) If $\vec{a}=a_{1} \hat{i}+a_{2} \hat{j}+a_{3} \hat{k}, \vec{b}=b_{1} \hat{i}+b_{2} \hat{j}+b_{3} \hat{k}$ and $\overrightarrow{\mathrm{c}}=\mathrm{c}_{1} \hat{\mathrm{i}}+\mathrm{c}_{2} \hat{\mathrm{j}}+\mathrm{c}_{3} \hat{\mathrm{k}}$ then $(\vec{a} \times \vec{b}) \cdot \vec{c}=[\vec{a} \vec{b} \vec{c}]=\left|\begin{array}{lll}a_{1} & a_{2} & a_{3} \\ b_{1} & b_{2} & b_{3} \\ c_{1} & c_{2} & c_{3}\end{array}\right|$
(b) $[\mathrm{a} \quad \mathrm{b} \quad \mathrm{c}]=$ volume of the parallelopiped whose coterminous edges are formed by $\vec{a}, \vec{b}, \vec{c}$
(c) $\vec{a}, \vec{b}, \vec{c}$ are coplanar if and only if $[\vec{a} \vec{b} \vec{c}]=0$
(d) Four points A, B, C, D with position vectors $\vec{a}, \vec{b}, \vec{c}, \vec{d}$ respectively are coplanar if and only if
$\left[\begin{array}{lll}\overrightarrow{\mathrm{AB}} & \overrightarrow{\mathrm{AC}} & \overrightarrow{\mathrm{AD}}\end{array}\right]=0$ i.e. if and only if
$\left[\begin{array}{lll}\vec{b}-\vec{a} & \vec{c}-\vec{a} & \vec{d}-\vec{a}\end{array}\right]=0$
(e) Volume of a tetrahedron with three coterminous edges $\vec{a}, \vec{b}, \vec{c}=\frac{1}{6}\left|\left[\begin{array}{lll}\vec{a} & \vec{b} & \vec{c}\end{array}\right]\right|$
(f) Volume of prism on a triangular base with three coterminous edges $\vec{a}, \vec{b}, \vec{c}=\frac{1}{2} \left\lvert\,\left[\begin{array}{lll}\vec{a} & \vec{b} & \vec{c}\end{array}\right]\right.$

## $>$ Lagrange's identity :

$$
(\overrightarrow{\mathrm{a}} \times \overrightarrow{\mathrm{b}}) \cdot(\overrightarrow{\mathrm{c}} \times \overrightarrow{\mathrm{d}})=\left|\begin{array}{cc}
\overrightarrow{\mathrm{a}} \cdot \overrightarrow{\mathrm{c}} & \overrightarrow{\mathrm{a}} \cdot \vec{d} \\
\overrightarrow{\mathrm{~b}} \cdot \overrightarrow{\mathrm{c}} & \overrightarrow{\mathrm{~b}} \cdot \vec{d}
\end{array}\right|=(\overrightarrow{\mathrm{a}} \cdot \overrightarrow{\mathrm{c}})(\overrightarrow{\mathrm{b}} \cdot \overrightarrow{\mathrm{~d}})-(\overrightarrow{\mathrm{a}} \cdot \overrightarrow{\mathrm{~d}})(\overrightarrow{\mathrm{b}} \cdot \overrightarrow{\mathrm{c}})
$$

Reciprocal system of vectors: If $\vec{a}, \vec{b}, \vec{c}$ be any three non coplanar vectors so that
$[\vec{a} \vec{b} \vec{c}] \neq 0$ then the three vectors $\vec{a}^{\prime} \vec{b}^{\prime} \vec{c}^{\prime}$ defined by the equations $\vec{a}^{\prime}=\frac{\vec{b} \times \vec{c}}{[\vec{a} \vec{b} \vec{c}]}, \vec{b}^{\prime}=\frac{\vec{c} \times \vec{a}}{[\vec{a} \vec{b} \vec{c}]}, \vec{c}^{\prime}=\frac{\vec{a} \times \vec{b}}{[\vec{a} \vec{b} \vec{c}]}$ are called the reciprocal system of vectors to the given vectors $\vec{a}, \vec{b}, \vec{c}$

## STATISTICS

Relation between A.M., G.M. and H.M.
A.M. $\geq$ G.M. $\geq$ H.M.

Equality sign holds only when all the observations in the series are same.
Relationship between mean, mode and median :
(i) In symmetrical distribution Mean $=$ Mode $=$ Median
(ii) In skew (moderately symmetrical) distribution Mode $=3$ median -2 mean
$>$ Mean deviation for ungrouped data
M.D. $(\bar{x})=\frac{\sum\left|x_{i}-\bar{x}\right|}{n}$, M.D. $(M)=\frac{\sum\left|x_{i}-M\right|}{n}$

Mean deviation for grouped data
M.D. $(\overline{\mathrm{x}})=\frac{\sum \mathrm{f}_{\mathrm{i}}\left|\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right|}{\mathrm{N}}, \quad$ M.D. $(\mathrm{M})=\frac{\sum \mathrm{f}_{\mathrm{i}}\left|\mathrm{x}_{\mathrm{i}}-\mathrm{M}\right|}{\mathrm{N}}$, where $N=\sum f_{i}$
Variance and standard deviation for ungrouped data

$$
\sigma^{2}=\frac{1}{\mathrm{n}} \sum\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}, \sigma=\sqrt{\frac{1}{\mathrm{n}} \sum\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}}
$$

$>$ Variance and standard deviation of a discrete frequency distribution

$$
\sigma^{2}=\frac{1}{\mathrm{n}} \sum \mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}, \sigma=\sqrt{\frac{1}{\mathrm{~N}} \sum \mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}}
$$

Variance and standard deviation of a continuous frequency distribution

$$
\sigma^{2}=\frac{1}{\mathrm{n}} \sum \mathrm{f}_{\mathrm{i}}\left(\mathrm{x}_{\mathrm{i}}-\overline{\mathrm{x}}\right)^{2}, \sigma=\sqrt{\frac{1}{\mathrm{~N}} \sum \mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}^{2}-\left(\sum \mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}\right)^{2}}
$$

Coefficient of variation (C.V.) $=\frac{\sigma}{\bar{x}} \times 100, \overline{\mathrm{x}} \neq 0$
For series with equal means, the series with lesser standard deviation is more consistent or less scattered.

## DIFFERENTIAL EQUATIONS

Methods of solving a first order first degree differential equation :
(a) Differential equation of the form $\frac{d y}{d x}=f(x)$
$\frac{d y}{d x}=f(x) \Rightarrow d y=f(x) d x$
Integrating both sides we obtain
$\int d y=\int f(x) d x+c$ or $y=\int f(x) d x+c$
(b) Differential equation of the form $\frac{d y}{d x}=f(x) g(y)$
$\frac{d y}{d x}=f(x) g(y) \Rightarrow \int \frac{d y}{g(y)}=\int f(x) d x+c$
(c) Differential equation of the form of $\frac{d y}{d x}=f(a x+b y+c)$ :

To solve this type of differential equations, we put
$a x+b y+c=v$ and $\frac{d y}{d x}=\frac{1}{b}\left(\frac{d v}{d x}-a\right)$
$\therefore \frac{d v}{a+b f(v)}=d x$
So solution is by integrating $\int \frac{d v}{a+b f(v)}=\int d x$
(d) Differential Equation of homogeneous type :

An equation in $x$ and $y$ is said to be homogeneous if it can be put in the form $\frac{d y}{d x}=\frac{f(x, y)}{g(x, y)}$ where $f(x, y)$ and $g$ $(\mathrm{x}, \mathrm{y})$ are both homogeneous functions of the same degree in $x \& y$.
So to solve the homogeneous differential equation
$\frac{d y}{d x}=\frac{f(x, y)}{g(x, y)}$, substitute $y=v x$ and so $\frac{d y}{d x}=v+x \frac{d V}{d x}$
Thus $\quad v+x \frac{d v}{d x}=f(v) \Rightarrow \frac{d x}{x}=\frac{d v}{f(v)-v}$
Therefore solution is $\int \frac{d x}{x}=\int \frac{d v}{f(v)-v}+c$

## Linear differential equations:

$\frac{d y}{d x}+P y=Q$
Where P and Q are either constants or functions of x .
Multiplying both sides of (1) by $e^{\int P d x}$, we get
$\mathrm{e}^{\int P d x}\left(\frac{d y}{d x}+P y\right)=Q e^{\int P d x}$
On integrating both sides with respect to $x$ we get

$$
y \mathrm{e}^{\int P d x}=\int \mathrm{Q} \mathrm{e}^{\int P d x}+c
$$

which is the required solution, where c is the constant and $e^{\int P d x}$ is called the integration factor.
