## SOLUTIONS

## SAMPLE PAPER-1

1. (d) L.C.M $\times$ H.C.F $=$ First number $\times$ second number Hence, required number $=\frac{36 \times 2}{18}=4$.
2. (a) Required equation is $x^{2}-6 x+6=0$.
3. (c) Here, $\frac{a_{1}}{a_{2}}=\frac{k}{12}, \frac{b_{1}}{b_{2}}=\frac{3}{k}, \frac{c_{1}}{c_{2}}=\frac{k-3}{k}$

For a pair of linear equations to have infinitely many solutions:
$\frac{a_{1}}{a_{2}}=\frac{b_{1}}{b_{2}}=\frac{c_{1}}{c_{2}}$
So, we have $\frac{k}{12}=\frac{3}{k}=\frac{k-3}{k}$ or $\frac{k}{12}=\frac{3}{k}$ which gives $k^{2}=36$ i.e., $k= \pm 6$

Also, $\frac{3}{k}=\frac{k-3}{k}$ gives $3 k=k^{2}-3 k$, i.e., $6 k=k^{2}$, which means $k=0$ or $k=6$.
Therefore, the value of $k$ that satisfies both the conditions, is $k=6$. For this value, the pair of linear equations has infinitely many solutions.
4. (a) Since zeroes are reciprocal of each other, so product of the roots will be 1 , so
$k^{2}-k-2=0 \Rightarrow(k-2)(k+1)=0$
$k=2, k=-1$, Since $k>0 \therefore k=2$
5. (a) H.C.F. $(91,126)=\frac{91 \times 126}{\text { L.C.M. }(91,126)}$
$=\frac{91 \times 126}{182}=13$
6. (a) (By definition of similar triangles).
7. (d) $\sec \theta+\tan ^{3} \theta \operatorname{cosec} \theta$
$=\sec \theta+\frac{\sin \theta}{\cos \theta} \tan ^{2} \theta \operatorname{cosec} \theta=\sec \theta\left(1+\tan ^{2} \theta\right)$
$=\left(1+\tan ^{2} \theta\right)^{3 / 2}=\left[1+\left(1-a^{2}\right)\right]^{3 / 2}$
8. (b) Now, in $\triangle \mathrm{DEF}$ and $\triangle \mathrm{PQR}$,
$\angle \mathrm{D}=\angle \mathrm{Q}, \angle \mathrm{R}=\angle \mathrm{E}$

$\therefore \quad \triangle \mathrm{DEF} \sim \Delta \mathrm{QRP}$
$\Rightarrow \quad \angle \mathrm{F}=\angle \mathrm{P}$
$\therefore \quad \frac{\mathrm{DF}}{\mathrm{QP}}=\frac{\mathrm{ED}}{\mathrm{RQ}}=\frac{\mathrm{FE}}{\mathrm{PR}}$
[by AAA similarity criterion]
[corresponding angles]
[corresponding sides]
9. (c) $\mathrm{PQ}=13 \Rightarrow \mathrm{PQ}^{2}=169$
$\Rightarrow \quad(\mathrm{x}-2)^{2}+(-7-5)^{2}=169$
$\Rightarrow \quad x^{2}-4 \mathrm{x}+4+144=169$
$\Rightarrow \mathrm{x}^{2}-4 \mathrm{x}-21=0 \Rightarrow \mathrm{x}^{2}-7 \mathrm{x}+3 \mathrm{x}-21=0$
$\Rightarrow(x-7)(x+3)=0 \Rightarrow x=7,-3$
10. (d) Given, $\tan \theta=\frac{a}{b}$
$\therefore \quad \frac{a \sin \theta-b \cos \theta}{a \sin \theta+b \cos \theta}=\frac{a \tan \theta-b}{a \tan \theta+b}=\frac{a^{2}-b^{2}}{a^{2}+b^{2}}$
11. (b) Suppose the required ratio is $\mathrm{m}_{1}: \mathrm{m}_{2}$ Then, using the section formula, we get

$$
\begin{aligned}
& -2=\frac{\mathrm{m}_{1}(4)+\mathrm{m}_{2}(-3)}{\mathrm{m}_{1}+\mathrm{m}_{2}} T \mathrm{M} \\
& \Rightarrow-2 \mathrm{~m}_{1}-2 \mathrm{~m}_{2}=4 \mathrm{~m}_{1}-3 \mathrm{~m}_{2} \\
& \Rightarrow m_{2}=6 m_{1} \Rightarrow m_{1}: m_{2}=1: 6
\end{aligned}
$$

12. (a) Area of the shaded region
$=\frac{40^{\circ}}{360^{\circ}} \times \frac{22}{7} \times(7)^{2}-\frac{40^{\circ}}{360^{\circ}} \times \frac{22}{7} \times(3.5)^{2}$
$=\frac{1}{9} \times \frac{22}{7} \times\left(7^{2}-3.5^{2}\right)=\frac{1}{9} \times \frac{22}{7} \times\left(49-\frac{49}{4}\right)$
$=\frac{1}{9} \times \frac{22}{7} \times \frac{49}{4} \times 3=\frac{77}{6} \mathrm{~cm}^{2}$
13. (b) Exterior angle of a cyclic quadrilateral is equal to its interior opposite angle.
$\angle \mathrm{BAC}=\angle \mathrm{DCA}$ and proceed.
14. (a) Let the radii of the outer and inner circles be $r_{1}$ and $r_{2}$ respectively; we have
Area $=\pi r_{1}^{2}-\pi r_{2}^{2}=\pi\left(\mathrm{r}_{1}^{2}-r_{2}^{2}\right)$
$=\pi\left(r_{1}-r_{2}\right)\left(r_{1}+r_{2}\right)$
$=\pi(5.7-4.3)(5.7+4.3)=\pi \times 1.4 \times 10 \mathrm{sq} . \mathrm{cm}$
$=3.1416 \times 14 \mathrm{sq} . \mathrm{cm} .=43.98 \mathrm{sq} . \mathrm{cms}$.
15. (a) Let the mean weight of a class of 35 students be $\bar{x}_{1}$ and that of both students and a teacher be $\overline{\mathrm{x}}_{2}$

Then $\overline{\mathrm{x}}_{1}=45 \mathrm{~kg}$ and
$\overline{\mathrm{x}}_{2}=45+\frac{500}{1000}=45+0.5=45.5 \mathrm{~kg}$
$\overline{\mathrm{x}}_{1}=\frac{\Sigma \mathrm{x}_{1}}{\mathrm{n}_{1}}, \quad \overline{\mathrm{x}}_{2}=\frac{\Sigma \mathrm{x}_{2}}{\mathrm{n}_{1}}$
$\Rightarrow 45=\frac{\Sigma \mathrm{x}_{1}}{35}, \quad 45.5=\frac{\Sigma \mathrm{x}_{2}}{36}$
$\Rightarrow \quad \Sigma \mathrm{x}_{1}=1575 \mathrm{~kg}, \Sigma \mathrm{x}_{2}=1638 \mathrm{~kg}$
$\Rightarrow$ Total weight $=$ weight of students + weight of teacher
$\therefore \quad$ Weight of teacher $=$ Total weight - weight of students
$\therefore \quad$ Weight of the teacher $=\Sigma \mathrm{x}_{2}-\Sigma \mathrm{x}_{1}$ $=1638-1575=63 \mathrm{~kg}$
16. (d) Volume of spherical shell
$=\frac{4}{3} \pi R^{3}-\frac{4}{3} \pi r^{3}=\frac{4}{3} \pi\left(R^{3}-r^{3}\right)$
17. (d) Clearly, the number of families having income range (in ₹)
$16000-19000=69-50=19$.
18. (d) $\because P(E)+P(\bar{E})=1$
19. (b) Put $n=1$ and $n=2$.
20. (a) Both Assertion and Reason are correct and Reason is the correct explanation of the assertion.
greatest side $=\sqrt{(3)^{2}+(4)^{2}}=5$ units.
21. Comparing the given equations with $a_{1} x,+b_{1} y=c_{1}$ and $a_{2} x+b_{2} y=c_{2}$ we have
$\therefore \quad \frac{\mathrm{a}_{1}}{\mathrm{a}_{2}}=\frac{1}{2} ; \frac{\mathrm{b}_{1}}{\mathrm{~b}_{2}}=\frac{2}{1} ; \frac{\mathrm{c}_{1}}{\mathrm{c}_{2}}=\frac{4}{5}$
[1 Mark]

To Prove : $\triangle \mathrm{ABC} \sim \triangle \mathrm{PQR}$
[1/2Mark]
Proof: $\frac{A B}{P Q}=\frac{B C}{Q R}$ (Given)

$\frac{2 B D}{2 Q M}=\frac{B C}{Q R} \therefore \frac{\mathrm{AB}}{\mathrm{PQ}}=\frac{\mathrm{BD}}{\mathrm{QM}}=\frac{\mathrm{AD}}{\mathrm{PM}}$
$\therefore \quad \triangle \mathrm{ABD} \sim \Delta \mathrm{PQM}(\mathrm{By} \mathrm{SSS})$

$\therefore \quad \angle \mathrm{B}=\angle \mathrm{Q}$ (By corresponding angles of similar triangles)
Now, In $\triangle \mathrm{ABC}$ and $\triangle \mathrm{PQR}, \frac{\mathrm{AB}}{\mathrm{PQ}}=\frac{\mathrm{BC}}{\mathrm{QR}}$ and $\angle \mathrm{B}=\angle \mathrm{Q}$

26. Let us assume on the contrary that $\sqrt{2}+\sqrt{5}$ is rational number. Then, there exist co-prime positive integers $a$ and $b$ such that

$$
\sqrt{2}+\sqrt{5}=\frac{a}{b} \Rightarrow \frac{a}{b}-\sqrt{2}=\sqrt{5}
$$

[ $1 / 2$ Mark]

$$
\begin{gathered}
\Rightarrow \quad\left(\frac{a}{b}-\sqrt{2}\right)^{2}=(\sqrt{5})^{2} \text { [Squaring both sides] [1/2 Mark] } \\
\Rightarrow \quad(a-\sqrt{2 b})^{2}=5 b^{2} \Rightarrow a^{2}+2 b^{2}-2 a b \sqrt{2}=5 b^{2} \\
\quad[1 / 2 \text { Mark] } \\
\Rightarrow \quad a^{2}+2 b^{2}-3 b^{2}=2 a b \sqrt{2} \Rightarrow \frac{a^{2}-3 b^{2}}{2 a b}=\sqrt{2}
\end{gathered}
$$

[1/2 Mark]
$\Rightarrow \quad \sqrt{2}$ is a rational number

$$
\left[\because a, b \text { areintegers } \Rightarrow \frac{a^{2}-3 b^{2}}{2 a b} \text { is rational }\right][1 / 2 \text { Mark }]
$$

This contradicts the fact that $\sqrt{2}$ is irrational. So, our assumption is wrong.
Hence, $\sqrt{2}+\sqrt{5}$ is irrational.

27. If $\alpha$ and $\beta$ are the zeroes of $2 x^{2}-3 x+1$,
then $\alpha+\beta=\frac{-b}{a}=\frac{3}{2}$ and $\alpha \beta=\frac{c}{a}=\frac{1}{2}$
[1 Mark]
New quadratic polynomial whose zeroes are $3 \alpha$ and $3 \beta$ is given by
$x^{2}-$ (Sum of the roots) $x+$ Product of the roots
$=x^{2}-(3 \alpha+3 \beta) x+3 \alpha \times 3 \beta$
[1 Mark]
$=x^{2}-3(\alpha+\beta) x+9 \alpha \beta=x^{2}-3\left(\frac{3}{2}\right) x+9\left(\frac{1}{2}\right)$
$=x^{2}-\frac{9}{2} x+\frac{9}{2}=\frac{1}{2}\left(2 x^{2}-9 x+9\right)$
[1 Mark]
Hence, required quadratic polynomial is $\frac{1}{2}\left(2 x^{2}-9 x+9\right)$.
28. $\frac{4}{x}+5 y=7$ and $\frac{3}{x}+4 y=5$
$\frac{4}{x}+5 y=7$
$\frac{3}{x}+4 y=5$
[1 Mark]
Multiply equation (i) by (3) and equation (ii) by (4) we get,

$$
\begin{equation*}
\frac{12}{x}+15 y=21 \tag{iii}
\end{equation*}
$$

$\frac{12}{x}+16 y=20$
Subtract (iii) and (iv), we get, $-\mathrm{y}=1 \Rightarrow \mathrm{y}=-1$ [1 Mark]
Now, putting the value of $y=-1$ in equation (i)
$\frac{4}{x}+5(-1)=7 \Rightarrow \frac{4}{x}=7+5 \Rightarrow \frac{4}{x}=\frac{12}{1} \Rightarrow 12 x$
